## What I Tried to Do

I wanted to see how GitHub Copilot CLI could help me figure out a tricky Git command without having to search online. My goal was to combine my last two local commits into a single commit with a new message before pushing my work.

## Setting Up

1. I checked that I had Node.js installed on my computer.
2. I installed Copilot CLI using `npm install -g @github/copilot`.
3. I logged into my GitHub account using `gh auth login` to make sure my Copilot subscription was working.

## My Question and Copilot's Answer

### What I Asked

"What command do I run to combine my last two unpushed local commits into a single commit with a new message?"

## What Copilot Showed Me

`git reset --soft HEAD~2`

`git commit -m "Your new commit message"`

## What Copilot Explained

It told me that `git reset --soft HEAD~2` takes me back two commits while keeping all my work saved and staged. Then, running `git commit -m "..."` lets me save everything under one clean commit. Since I haven't pushed anything to GitHub yet, doing this won't break anything on the main project.

## Screenshot Evidence
